

Avoid Downtime and Unexpected Repairs

You will receive peace of mind heading into season knowing that routine maintenance is done before season arrives. It's time well spent, a recent farming report states that farmers can cut repair costs by **25%** by keeping up with routine maintenance.

Without routine farm machinery and agricultural equipment maintenance, you might waste valuable time and favorable weather conditions and important steps in production. You can't afford down time! If equipment problems are just too big to fix, it's time to contact GK Machine's Repair Department. They will assist with complex issues such as:

- Stalls or loss of power during operation
- Malfunctioning computers or GPS devices
- Malfunctioning sensors, such as hydraulic sensors

Keeping Costs Down on Routine Agricultural Maintenance

Running out for parts to fix broken farm equipment can get expensive. Not only can replacement parts be expensive, but driving to your nearest supplier takes time away from other tasks you could be doing. One way to keep costs down on routine agricultural maintenance is to keep a supply of parts you know you'll need for the season. GK's parts counter can help you keep the parts you need in stock and ready to go.

Farmers are Do-It-Yourself People

Farmers like to tinker with machines, trying to adapt one kind of machine to another task. While this may have been easy to do with older farm equipment, the modern computerized farm machines can be ruined by modifications. GK cautions against at-home modifications of newer farm equipment. Let the experts at GK Machine assist you with design, build and installation.
